

Okay, to install on Mac, you're going to download the software and then when you go to open it, it's going to say it can't be opened because it's from an unidentified developer. We're not a big corporation, so it doesn't recognize this. You just click, okay. Then you need to open system preferences, privacy and security, and you're going to click on, open anyway. When you do that, it's going to give you the option to open it, click open, and then it's going to lead you through the install. You just click, continue, tick the license agreement, continue, and then you can say, "Agree." You continue to that, and then it's going to ask you about the installation. You continue. If it needs your username and password in order to install new software, enter that and then it will write the files to your drive. It will set up the software on your computer, and that's all there is to it. The next thing will be to activate the software, and I'll show you that on another video with your license key.
