

KANTAR

**G7 countries
perception of
COVID-19**

Wave 3

A study across Canada, France,
Germany, Italy, Japan, Great
Britain and the United States of
America

June 2020

1 Methodology

2 Detailed results

In this report, the percentages may not always sum to 100% due to:

- Rounding
- At some questions respondents can provide more than one response (in this case the sum of the percentages can be greater than 100%);

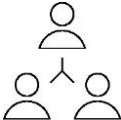

Due to rounding in the figures, in places, some 'net' totals may appear higher or lower than the total of the addends stated. **Please contact public@kantar.com for further information or the data tables.**

Annex 1

Weighting

Weighting approach and data reliability assessment

All the data has been post-stratified so that the samples are representative of the relevant country population with respect to:

- (i) gender crossed by age group, and
- (ii) gender crossed by degree-holding status (among 25-64 year olds).

Gender and age statistics were sourced from the US Census Bureau* and education statistics from the OECD**

Weighted and unweighted sample distributions for each country are shown on the following pages.

The country-level survey percentages quoted in this report have a standard margin of error*** of plus or minus three to four percentage points. However, analysts should be avoid drawing firm inferences from small between-country differences in results.

*<https://www.census.gov/data-tools/demo/idb/region.php?N=%20Results%20&T=15&A=separate&RT=0&Y=2020&R=-1&C=CA,FR,GM,IT,JA,UK,US> was used as the search term.

**<https://www.oecd.org/education/education-at-a-glance/educationataglance2019-dataandmethodology.htm> indicator A1, tables A1.1 and A1.2. Note that the age 25-34 male:female tertiary education ratio in table A1.2 has been used as a proxy for the male:female degree-holding ratio for the age range 25-64.

***The 'standard margin of error' is equivalent to the 95% confidence interval conditional on the sample being treated as a random sample from the population. An online panel sample is not a random sample but is weighted to reflect the demographic profile expected from a random sample and will usually have a similar 'random error' risk. The standard margin of error may be interpreted as a 5% risk that the true population value lies outside of the stated range (conditional on the sample assumptions outlined above).

Canada – unweighted and weighted distributions
