		f) g)	Use of phonetics for civil aircraft Use of phonetics for identification of	53
		h)	low frequency airways and air routes Identification of VHF airways	54 55
		i)	Use of language initially chosen by pilot unless requested to change	55
		j)	Inadvertent use of wrong language by controller	55
		k)	Inadvertent use of wrong language by pilot	56
		1)	Initial radio contact where pilot	56
		m)	language unknown Relay of clearances by pilot of another aircraft	56
		n)	Coordination of language between two IFR units	57
		o)	Coordination of language between IFR	
		p)	units and towers and Aeradio stations Clearance readbacks	57 57
		q)	Provision of seldom used phraseology at the controller position by means of plasticized reference cards or by OIDS	
		r)	display Establish local procedures for	58
			unilingual French pilot forced into English only airspace	58
		s)	A requirement that the Montreal Terminal Arrival Controller provide the tower controllers with the information on the position of all arriving IFR	
	6.2	The	aircraft	59
	0.2	a)	testing of the procedures Exchange of traffic in the holding pattern	59 60
		b) c) d) e)	Exchange of traffic for merging targets Use of phonetics for civil aircraft Clearance readbacks Establish local procedures for	60 60 61
			unilingual French-speaking pilot forced into English only airspace	61
	6.3		lication of bilingual procedures to er IFR units	61
7.	vario	ous p	mentation required pertaining to the procedures developed in order to	
	faci	litat	e evaluation of those procedures	62

8	. č	at th recon	icisms directed at the <sup>*</sup> conduct of the study, he findings reported, at the procedures mmended and at the adequacy of the methods in developing and testing the procedures	63
•		8.1	Criticisms relating to the conduct of the study a) The length of simulations was not adequate to establish a data base capable of revealing the actual	63
• •		•	<pre>detrimental impact of the use of a second language b) The controllers' workload c) The constraints</pre>	63 65 68 68
		• ••	<ul> <li>i) Simulation equipment</li> <li>ii) Aircraft characteristics</li> <li>iii) Pilot characteristics</li> <li>iv) Experience of controllers</li> <li>v) Presence of observers</li> </ul>	69 69 70 70
			vi) Controller motivation vii) Noise in communications viii) The simulations were carried out	70 71
			under "sterile" conditions ix) The Enroute and Terminal sectors were not simulated	71 72
			coincidentally x) The physical arrangements of the pilot positions xi) The traffic used was for the	72
	7		most part identical on each day d) The lack of realism e) The lack of pilot or user input and the	72 74 75
			failure to test the pilot function f) The associations were not invited to participate in the preparation of the BICSS report, in the monitoring in the real world carried out as a related study nor in the visits to Europe and	73
<b>7</b> .			Mexico, another related study g) Limitations inherent in simulation	79 79
		8.2	<ul> <li>a) The reliability of the statistics upon which the analysis was performed, and</li> </ul>	81
			upon which the findings are ultimately based	81
